Disruptive technologies are innovations that help create new markets and eventually go on to disrupt an existing market and value networks, displacing an earlier technology. This term, coined by Harvard Business School professor Clayton M. Christensen, is often used in business and technology literature to describe innovations that improve a product or service in ways that the market does not expect.

11 Awesome Examples of Disruptive Technology (MUST READ)

Recently, there has been a lot of buzz surrounding emerging and disruptive technologies. Many of these innovations involve modern technologies such as artificial intelligence (AI), robots, blockchain, internet of things (IoT), 3D printing and biometrics, just to name a few. The term "emerging technology" is pretty self-explanatory, but an emerging technology doesn't always become a disruptive technology.

Disruption: Emerging Technologies and the Future of Work Disruption explores the impact of emerging technologies in career paths, including technologies such as 3D printing, alternative energies, autonomous vehicles, artificial intelligence, biotech, Internet of Things, nanotechnology, space exploration, super materials, robotics, and virtual reality. Written without technical jargon, Disruption guides the reader through a fascinating journey of the new world around the corner. Based on widely validated scientific facts, this book paints a picture of what the industry landscape will be like from 2020 onward. This is what readers of the draft manuscript are saying: "One of the best primers on emerging technology available anywhere." "A window into the work and career opportunities for the decade to come." "It is clear to me now that traditional career paths are about to experience some serious disruption." "A real eye opener." "A great tool for the global STEM movement." "A bit frightening, but inspiring nevertheless." "I wouldn't be surprised if this book is cited as the inspiration behind some prominent techies a few years down the road." Disruption is a must-read for entrepreneurs, business executives, parents, students, teachers, career guides, analysts, and anyone in an advisory or decision-making capacity.

Disruptive Technologies outlines the steps businesses can take to engage with emerging technologies today in order to serve the consumer of tomorrow. This book offers the knowledge and tools to engage confidently with emerging technologies for better business. This highly practical book offers organizations a distinct response to emerging technologies including Blockchain (Bitcoin), artificial

intelligence, graphene and nanotechnology (among others) and other external factors (such as the sharing economy, mobile penetration, millennial workforce, ageing populations) that impact on their business, client service and product model. Disruptive Technologies provides a clear roadmap to assess, respond to and problem-solve: what are the upcoming changes in technology, roughly when to respond, and what's the best response? By using a quick-to-master evaluation and decision-making framework - structured around the key dimensions of Technology, Behaviour and Data (TBD). Emerging technologies guru Paul Armstrong offers a clear guide to the key disruptive technologies and a toolbox of frameworks, checklists, and activities to evaluate their possibilities. Disruptive Technologies enables forecasting of potential scenarios, implementation of plans, alternative strategies and the ability to handle change more effectively within an organization. The essential tool for all professionals who need to get to grips with emerging technologies fast and strategically.

Technological innovations are key causal agents of surprise and disruption. In the recent past, the United States military has encountered unexpected challenges in the battlefield due in part to the adversary's incorporation of technologies not traditionally associated with weaponry. Recognizing the need to broaden the scope of current technology forecasting efforts, the Office of the Director, Defense Research and Engineering (DDR&E) and the Defense Intelligence Agency (DIA) tasked the Committee for Forecasting Future Disruptive Technologies with providing guidance and insight on how to build a persistent forecasting system to predict, analyze, and reduce the impact of the most dramatically disruptive technologies. The first of two reports, this volume analyzes existing forecasting methods and processes. It then outlines the necessary characteristics of a comprehensive forecasting system that integrates data from diverse sources to identify potentially game-changing technological innovations and facilitates informed decision making by policymakers. The committee's goal was to help the reader understand current forecasting methodologies, the nature of disruptive technologies and the characteristics of a persistent forecasting system for disruptive technology. Persistent Forecasting of Disruptive Technologies is a useful text for the Department of Defense, Homeland Security, the Intelligence community and other defense agencies across the nation.

In Beyond Disruption: Technology's Challenge to Governance, George P. Shultz, Jim Hoagland, and James Timbie present views from some of the country's top experts in the sciences, humanities, and military that scrutinize the rise of post-millennium technologies in today's global society. They contemplate both the benefits and peril carried by the unprecedented speed of these innovations—from genetic editing, which enables us new ways to control infectious diseases, to social media, whose ubiquitous global connections threaten the function of democracies across the world. Some techniques, like the advent of machine learning, have enabled engineers to create systems that will make us more productive. For example, self-driving vehicles promise to make trucking safer, faster, and cheaper. However, using big data and artificial intelligence to automate complex tasks also ends up threatening to disrupt both routine professions like taxi driving and cognitive work by accountants, radiologists, lawyers, and even computer programmers themselves.

Almost 15 years ago, in *The World is Flat*, Thomas Friedman popularized the latest wave of globalization as a world of giant corporate supply chains that tripled world trade between 1990 and 2010. Major corporations such as Apple, Dell, and GE offshored manufacturing to low-cost economies; China became the world's factory, mass-producing and exporting computers and gadgets to Western shoppers. This paradigm of globalization has dominated global trade policy-making and guided hundreds of billions of dollars in business investments and development spending for almost three decades. But we are now on the cusp of a new era. *Revolutionizing World Trade* argues that technologies such as ecommerce, 3D printing, 5G, the Cloud, blockchain, and artificial intelligence are revolutionizing the economics of trade and global production, empowering businesses of all sizes to make, move, and market products and services worldwide and with greater ease than ever before. The twin forces of digitization and trade are changing the patterns, players, politics, and possibilities of world trade, and can reinvigorate global productivity growth. However, new policy challenges and old regulatory frameworks are stifling the promise of this most dynamic, prosperous, and inclusive wave of globalization yet. This book uses new empirical evidence and policy experiences to examine the clash between emerging possibilities in world trade and outdated policies and institutions, offering several policy recommendations for navigating these obstacles to catalyze growth and development around the world.

This book will lift the lid on the main emerging technologies businesses will encounter and offers a clear framework for choosing the best strategic response.

It used to take years or even decades for disruptive innovations to dethrone dominant products and services. But now any business can be devastated virtually overnight by something better and cheaper. How can executives protect themselves and harness the power of Big Bang Disruption? Just a few years ago, drivers happily spent more than \$200 for a GPS unit. But as smartphones exploded in popularity, free navigation apps exceeded the performance of stand-alone devices. Eighteen months after the debut of the navigation apps, leading GPS manufacturers had lost 85 percent of their market value. Consumer electronics and computer makers have long struggled in a world of exponential technology improvements and short product life spans. But until recently, hotels, taxi services, doctors, and energy companies had little to fear from the information revolution. Those days are gone forever. Software-based products are replacing physical goods. And every service provider must compete with cloud-based tools that offer customers a better way to interact. Today, start-ups with minimal experience and no capital can unravel your strategy before you even begin to grasp what's happening. Never mind the "innovator's dilemma"—this is the innovator's disaster. And it's happening in nearly every industry. Worse, Big Bang

Disruptors may not even see you as competition. They don't share your approach to customer service, and they're not sizing up your product line to offer better prices. You may simply be collateral damage in their efforts to win completely different markets. The good news is that any business can master the strategy of the start-ups. Larry Downes and Paul Nunes analyze the origins, economics, and anatomy of Big Bang Disruption. They identify four key stages of the new innovation life cycle, helping you spot potential disruptors in time. And they offer twelve rules for defending your markets, launching disruptors of your own, and getting out while there's still time. Based on extensive research by the Accenture Institute for High Performance and in-depth interviews with entrepreneurs, investors, and executives from more than thirty industries, Big Bang Disruption will arm you with strategies and insights to thrive in this brave new world.

Helps leaders and entrepreneurs capitalize on the opportunity for new products and services presented by the changes caused by science and technology, policy and regulation, business models and social dynamics.

Our intuition on how the world works could well be wrong. We are surprised when new competitors burst on the scene, or businesses protected by large and deep moats find their defenses easily breached, or vast new markets are conjured from nothing. Trend lines resemble saw-tooth mountain ridges. The world not only feels different. The data tell us it is different. Based on years of research by the directors of the McKinsey Global Institute, *No Ordinary Disruption: The Four Forces Breaking all the Trends* is a timely and important analysis of how we need to reset our intuition as a result of four forces colliding and transforming the global economy: the rise of emerging markets, the accelerating impact of technology on the natural forces of market competition, an aging world population, and accelerating flows of trade, capital and people. Our intuitions formed during a uniquely benign period for the world economy—often termed the Great Moderation. Asset prices were rising, cost of capital was falling, labour and resources were abundant, and generation after generation was growing up more prosperous than their parents. But the Great Moderation has gone. The cost of capital may rise. The price of everything from grain to steel may become more volatile. The world's labor force could shrink. Individuals, particularly those with low job skills, are at risk of growing up poorer than their parents. What sets *No Ordinary Disruption* apart is depth of analysis combined with lively writing informed by surprising, memorable insights that enable us to quickly grasp the disruptive forces at work. For evidence of the shift to emerging markets, consider the startling fact that, by 2025, a single regional city in China—Tianjin—will have a GDP equal to that of the Sweden, of that, in the decades ahead, half of the world's economic growth will come from 440 cities including Kumasi in Ghana or Santa Carina in Brazil that most executives today would be hard-pressed to locate on a map. What we are now seeing is no ordinary disruption but the new facts of business life—facts that require executives and leaders at all levels to reset their operating assumptions and management intuition.
