P-wave is the "fast" wave and can be called a push-pull wave, because it moves by contracting and ex-panding along a horizontal path . The second major type of seismic wave is called an S-wave. S-waves are shear waves and move from side-to-side. S-waves are slower than P-waves. The particle motion in shear waves is perpendicular to

The purpose of the lab is to study the types of waves and their properties using a slinky. Procedure: 1. Select a lab partner and gather the lab materials. 2. On a smooth floor, stretch the slinky out between you and your partner, to a length of about four meters. (Caution – Do not over stretch the slinky!) 3. Send a single wave to your partner (see below). 4. Observe what happens to the wave when it reaches your partner ' s end.

Read Book Waves Slinky Lab Answer Key Wave Properties be described as an energy disturbance that travels through a medium from one location to another. Waves, simply put, are energy moving from one place to another. As the wave moves through the medium (water, slinky, air), energy is being passed from one particle to the next. Waves occur around us every day.

Seismic Slinky Analysis: Answer the following questions using complete sentences. 1. Contrast the movement of P and S waves in the slinky? 2. How did the density of the slinky affect the speed of the waves? 3. What happened to the wave when it reached the boundary between the plastic and metal slinkies?

Activity—Seismic Slinky

The Slinky Lab Simulation provides the user with a virtual slinky. The slinky consists of a collection of dots to represent its coils. Any individual dot can be grabbed at one location and shook back and forth to create vibrations. The vibrations travel through the slinky from the location where it is shook to the ends and then back.

Physics Simulation: Slinky Lab

Students will produce P and S waves using a Slinky© to understand how seismic waves transfer energy as they travel through solids. All types of waves transmit energy, including beach waves, sound, light, and more. When an earthquake occurs it generates four different types of seismic waves.

Seismic Wave : an elastic wave generated by an impulse such as an earthquake or an explosion. Seismic waves may travel either through the earth ' s interior (P and S waves; the fastest waves) or along or near the earth ' s surface (Rayleigh and Love waves). Seismic waves travel at speeds of several kilometers per second. P Wave: compressional

Slinkies prove to be a good tool for modeling the behavior of compressional P waves and shearing S waves. We recommend reading about the behavior of seismic waves and watching the variety of animations linked to this animation to understand how they travel, and how the P, S, and surface waves differ from each other.
