 When in addition $\mu(\Omega) = 1$, we call the measure μ a probability measure, and often label it by P (it is also easy to see that then $P(A) \in [0, 1]$ for all $A \in \mathcal{F}$). Remark. When (b) of Definition 1.1.2 is relaxed to involve only finite collections of disjoint sets A_n , we say that μ is a finitely additive non-negative set-function.
